# CONTROL SYSTEM

# INTRODUCTION TO CONTROL SYSTEMS

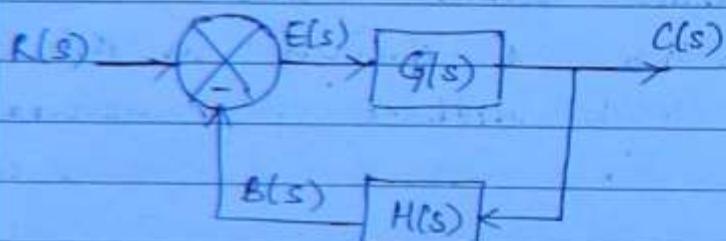

(3)

1. Consider a liquid level control system whose control objective is to maintain the water level in the tank at a height 'h'
2. Controller is an automatic device with error signal  $E(s)$  as input & controller output  $P(s)$  affecting the dynamics on the plant to achieve the control objective.  
∴ Controller output  $P = f(E)$  where  $E = \text{error}$
3. The different modes of controller operation are proportional, proportional + integral & proportional + derivative
4. There are 2 basic control loop configurations
  - i) Closed loop (or) Feedback control system
    - In this configuration, the changes in the output are measured through feedback & compared with the input or "set point" to achieve control objective
    - Feedback implies measurement (sensors or transducers)

$$E(s) = R(s) - B(s)$$

$$C(s) = R(s) - C(s) H(s)$$

$$G(s)$$

$$B(s) = G(s)R(s) - G(s)H(s) \cancel{+ C(s)}$$

## ii) Open Loop Control Systems -

- In this configuration, the feedback or measurement is not connected to the forward path or controller (open loop)
- These systems are conditional control systems, formulated under the basic condition that the system is not subject to any type of disturbance.
- Feedback in an open loop system except for displaying the information about the output has no major significance. This insignificance of feedback is termed as elimination / removal of feedback.
- Open Loop systems are more stable than closed loop systems & hence do not require any performance analysis.
- The application of Open Loop control is limited because they are conditional control systems.

## CONCEPT OF TRANSFER FUNCTIONS -

It is a mathematical model representing a control system relating input & output in the form of the ratio i.e.  $\frac{\text{Output}}{\text{Input}}$

$$V = Ri + L \frac{di}{dt}$$

Applying L.T.

$$\begin{aligned} V(s) &= I(s)R + LsI(s) \\ &= I(s)[R + Ls] \end{aligned}$$

$$\underline{I(s)} = \underline{1}$$

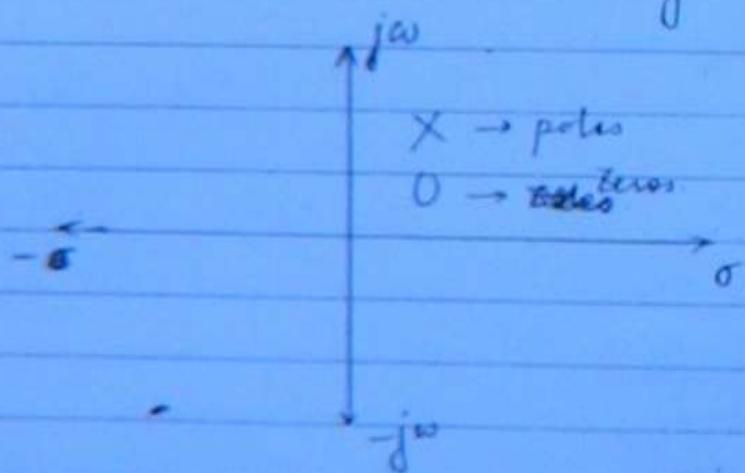

$$\underline{V(s)} = \underline{R + Ls}$$

$$\underline{I(s)} = \underline{\frac{1}{R + Ls}}$$

$$\underline{V(s)} = \underline{\left( s + \frac{R}{L} \right)}$$

$$\text{TF} = F(s) = \frac{N(s)}{D(s)} = \frac{C(s)}{R(s)} = \frac{k(s + z_1)(s + z_2)}{(s + p_1)(s + p_2)} \quad (1)$$

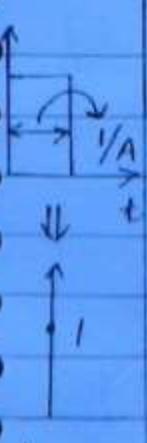

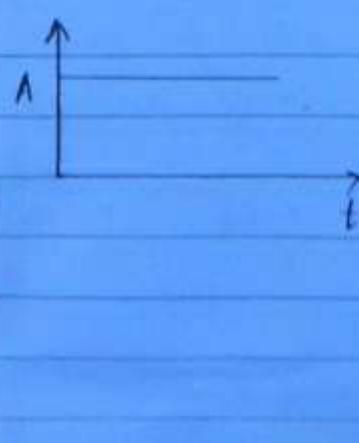

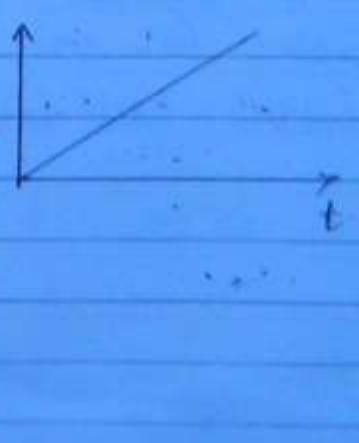

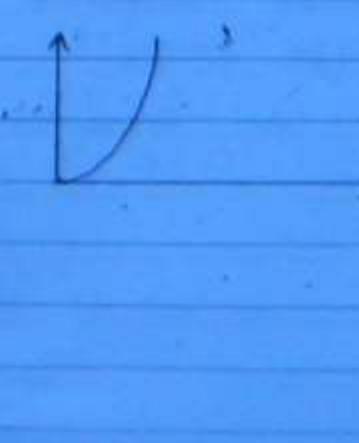

$k$  = system gain

$$\begin{aligned} s &= \sigma + j\omega \\ (\text{s-plane}) \end{aligned}$$

- \* From eq (1), transfer function of LTI system may be defined as ratio of Laplace transform of output to Laplace transform of input under the assumption that systems initial conditions are zero
- \* Poles & zeros are those critical frequencies which make the transfer function infinity or zero. Poles & zeros represent system parameters only.

Singularity Functions of Transfer Functions -  
the standard time domain test signals are also known as singularity functions which define the transfer function of LTI system

$(s) = 1$	$R(s) = A$ $s$	$R(s) = \frac{A}{s^2}$	$R(s) = \frac{A}{s^3}$
			

$$T.F = F(s) = \frac{C(s)}{R(s)}$$

(8)

$$C(s) = F(s) \times R(s)$$

Let  $R(s) = \text{Impulse signal} = 1$

$C(s) = \text{Impulse Response}$

$$= F(s) \times 1$$

$$\therefore T.F = F(s) \rightarrow ②$$

$\underline{L}(\text{Impulse Response}) = T.F.$

[WEIGHTING FUNCTION]

$\frac{d}{dt}(\text{Parabolic Response}) = \text{Ramp response}$

$\frac{d}{dt}(\text{Ramp Response}) = \text{Step response}$

$\frac{d}{dt}(\text{Step Response}) = \text{Impulse Response}$

$\frac{d}{dt}(\text{Impulse Response}) = T.F.$

The impulse response of a system is

$$C(t) = -te^{-t} + 2e^{-t} \quad (t > 0)$$

Its open loop transfer function will be

a)  $\frac{2s+1}{(s+1)^2}$

b)  $\frac{2s+1}{s+1}$

c)  $\frac{2s+1}{s^2}$

d)  $\frac{2s+1}{s}$

$$C(t) = -te^{-t} + 2e^{-t}$$

$$T.F. = C(s) = \frac{-1}{(s+1)^2} + \frac{2}{s+1} = \frac{2s+1}{(s+1)^2}$$

$$TF = \frac{2s+1}{(s+1)^2}$$

(9)

$$\frac{G(s)}{1 + H(s)G(s)} = \frac{2s+1}{(s+1)^2}$$

$$H(s)G(s) = ?$$

$$\text{ Ideally } H(s) = 1$$

$$\frac{G(s)}{1 + G(s)} = \frac{2s+1}{(s+1)^2}$$

$$\Rightarrow G(s)[(s+1)^2] = [1 + G(s)](2s+1)$$

$$\Rightarrow G(s)[(s+1)^2 - (2s+1)] = 2s+1$$

$$\Rightarrow G(s) = \frac{2s+1}{s^2} \quad (0)$$

Shortcut

$$TF = \frac{2s+1}{(s+1)^2}$$

$$G(s) = \frac{2s+1}{(s+1)^2 - (2s+1)} \quad \text{only for } H(s) = 1 \quad \frac{N}{D-N}$$

$$G(s) = \frac{2s+1}{s^2}$$

Q8. What is the open loop DC gain of a unity negative feedback system having closed loop TF  $\frac{s+4}{s^2 + 7s + 13}$

- a)  $\frac{4}{13}$    b)  $\frac{4}{9}$    c) 4   d) 13

10)

$$TF = \frac{s+4}{s^2 + 7s + 13}$$

$$\frac{G(s)H(s)}{1 + G(s)H(s)} = \frac{s+4}{s^2 + 7s + 13 - (s+4)} = \frac{s+4}{s^2 + 6s + 9}$$

$$G(s) = \frac{s+4}{s^2 + 6s + 9}$$

$$H(s) = 1$$

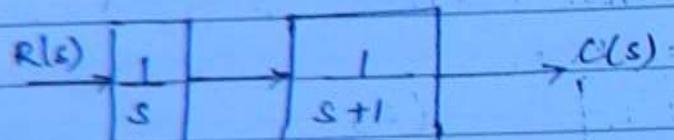

(10)

$$s > 0$$

$$G(s) = \frac{0+4}{0+0+9}$$

$$G(s) = \frac{4}{9} \quad \text{(b)}$$

Q3. Find the impulse response of the system

$$\text{Impulse response} = L^{-1}(\text{TF})$$

$$= L^{-1}\left[\frac{1}{s(s+1)}\right] \rightarrow \text{partial fractions}$$

$$= L^{-1}\left[\frac{1}{s} - \frac{1}{s+1}\right]$$

$$= 1 - e^{-t} \quad \text{Ans}$$

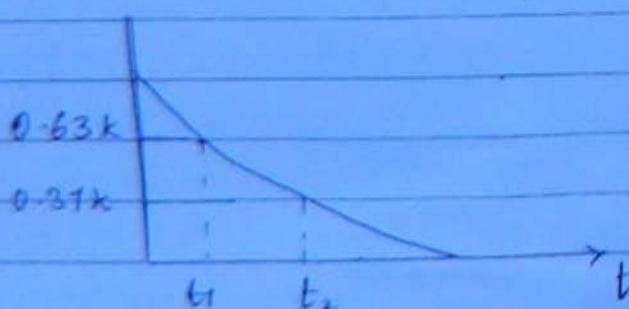

→ X →

Q4. The Impulse Response of the system having

$$\text{T.F. } C(s) = K$$

$$R(s) = \frac{K}{(s+\alpha)}$$

is shown in figure

The value of  $\alpha$  will be

- a)  $t_1$    b)  $\frac{1}{t_1}$    c)  $t_2$    d)  $\frac{1}{t_2}$

$$30) \text{ Impulse Response } = L^{-1}(T.F) = L^{-1} \frac{k}{s+a} = \frac{ke^{-at}}{s+a} \quad (1)$$

At  $t = t_2$

$$ke^{-at_2} = 0.37 k$$

$$e^{-at_2} = 0.37$$

$$ke^{-at_2} = ke^{-t}$$

$$at_2 = t$$

$a = \frac{1}{t_2}$	Answ.

Q5. A certain CS. has input  $R(t)$  &  $C(t)$  output  
If the input is first passed through a block having  
TF  $e^{-s}$  and then applied to the system, the  
modified output will be

- a)  $C(t-1) u(t)$
- b)  $C(t) u(t-1)$
- c)  $C(t-1) u(t-1)$
- d) None

sol) (c) By Laplace transformation theorem

$$R(s) \rightarrow [F(s)] \rightarrow C(s)$$

$$C(s) = R(s) F(s)$$

$$R(s) \xrightarrow{[e^{-s}]} [F(s)] \rightarrow C_m(s)$$

$$C_m(s) = R(s) e^{-s} F(s)$$

$$C_m(s) = C(s) e^{-s}$$

$$L^{-1} F(s) e^{-as} = \int (t-a) u(t-a) \cdot$$

$$L^{-1} C(s) e^{-s} = C(t-1) u(t-1) \rightarrow \text{Ans}$$

8. The Unit Step Response of the system is

$$Y(t) = te^{-t} \quad (t > 0)$$

So T.F will be

(12)

- a)  $\frac{1}{(s+1)^2}$
- b)  $\frac{1}{(s+1)}$
- c)  $\frac{s}{(s+1)^2}$
- d)  $\frac{s}{(s+1)}$

b) T.F =  $\frac{\mathcal{L}(te^{-t})}{R(s)} C(s)$

$$= \frac{1}{s^2} \cdot \frac{s}{(s+1)^2} - (C)$$

Using (3)  $\mathcal{L}(1) = \frac{1}{s}$  and  $\mathcal{L}(e^{-t}) = \frac{1}{s+1}$

we get a repeated root  $s+1$  in the denominator all the time

$\frac{d}{dt}$  (Step Response) = Impulse Response

$$\frac{d}{dt} Y(t) = Y'(t) = -te^{-t} + e^{-t}$$

~~$t \neq 0$~~

$$\mathcal{L}(Y'(t)) = T.F = \frac{-1}{(s+1)^2} + \frac{1}{(s+1)}$$

$$T.F = \frac{s}{(s+1)^2}$$

Q. The step response of the system is  
 $C(t) = 5 - \frac{4}{8}e^{-2t} + 8e^t \quad (t > 0)$

(13)

The gain of the T.F. in time constant form will be  
 a) -7.5 b) -7 c) 7.5 d) 7.

so)  $T.F. = \frac{C(s)}{R(s)}$

$\frac{d}{dt}$  (Step response) = Impulse Response

$$\begin{aligned}\frac{d}{dt}(C(t)) &= C'(t) = \frac{-4}{8}(-2)e^{-2t} + 8(-1)e^{-t} \\ &= e^{-2t} - 8e^{-t}\end{aligned}$$

$$\begin{aligned}L(C'(t)) &= T.F. = \frac{1}{(s+2)} - \frac{8}{(s+1)} \\ &= \frac{(s+1) - 8(s+2)}{(s+2)(s+1)} \\ &= \frac{-7s - 15}{(s+2)(s+1)} \\ &= \frac{-7(s + 15/7)}{(s+2)(s+1)}\end{aligned}$$

Time constant form  $(1 \pm Ts)$

$$T.F. = -7 \times \frac{15}{7} \left[ 1 + \frac{Ts}{15} \right]$$

→ depend only on poles

known as natural

$$\begin{aligned}&2[1 + 0.5s] / [1 + s] \\ &= -7.5 \left( 1 + \frac{Ts}{15} \right) \\ &\quad (1 + 0.5s)(1 + s)\end{aligned}$$

Introduction to COMPENSATORS

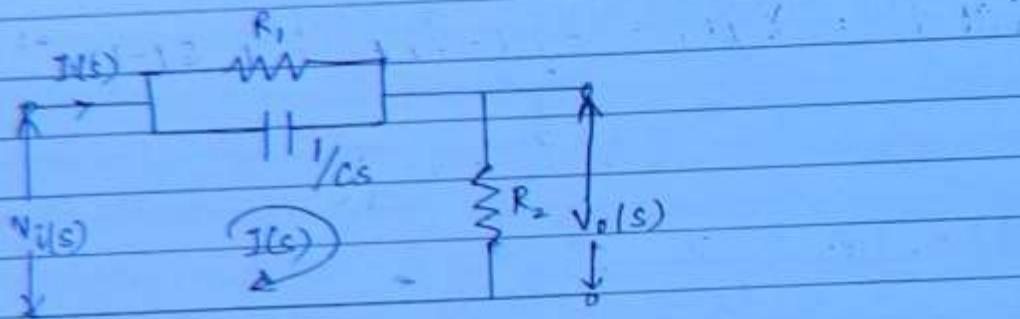

(14)

Compensators in control Systems are used for improving the performance specifications i.e transient & steady state response characteristics.

They are of 3 types -

### 1. Lead Compensator

It is used for improving the transient state or speed of response of the system.

$$V_i(s) = I(s) \left[ \frac{R_1 + R_2}{R_1 C s + 1} \right]$$

$$= I(s) \left[ \frac{R_1 + R_2 + R_1 R_2 C s}{R_1 C s + 1} \right]$$

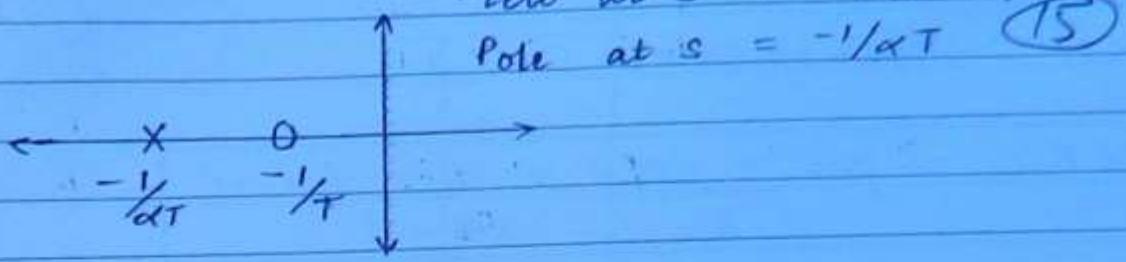

$$V_o(s) = I(s) R_2$$

$$\frac{V_o(s)}{V_i(s)} = \frac{R_2 (R_1 C s + 1)}{R_1 + R_2 + R_1 R_2 C s}$$

$T = R_1 C$	$\alpha = \text{Attenuation Gain} = \frac{R_2}{R_2 + R_1} \quad (\alpha < 1)$
-------------	---

$$= \frac{R_2 (R_1 C s + 1)}{R_1 + R_2 \left[ 1 + \frac{R_1 R_2 C s}{R_1 + R_2} \right]}$$

$V_o(s) = \frac{\alpha (1 + T s)}{(1 + \alpha T s)}$
--

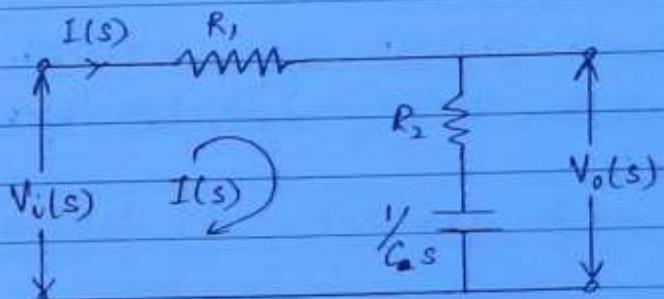

NOTE → The frequency nearest to origin is a zero in a LEAD compensator. Therefore its effect is not dominating.

If zero is added to a system TF it will represent behavior as a LEAD compensator.

## II. Lag compensator

It is used for improving the steady state response characteristics of the system i.e. elimination of steady state error b/w output & input.

$$V_i(s) = I(s) \times \left[ R_1 + R_2 + \frac{1}{C_s s} \right]$$

$$= I(s) \left[ \frac{R_1 C_s + R_2 C_s + 1}{C_s s} \right]$$

$$V_o(s) = I(s) \left[ R_2 + \frac{1}{C_s s} \right]$$

$$= I(s) \left[ \frac{R_2 C_s + 1}{C_s s} \right]$$

(16)

$$V_o(s) = \frac{R_2 Cs + 1}{R_1 Cs + R_2 Cs + 1}$$

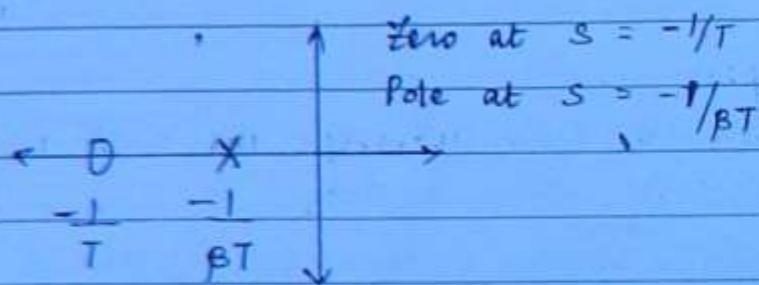

$$T = R_2 C \quad \beta = \frac{R_1 + R_2}{R_2} \approx 1 \quad (\beta > 1)$$

$$= R_2 Cs + 1$$

$$\frac{R_2 Cs}{R_2} \frac{(R_1 + R_2) + 1}{R_2}$$

$$V_o(s) = \frac{1 + Ts}{1 + \beta Ts}$$

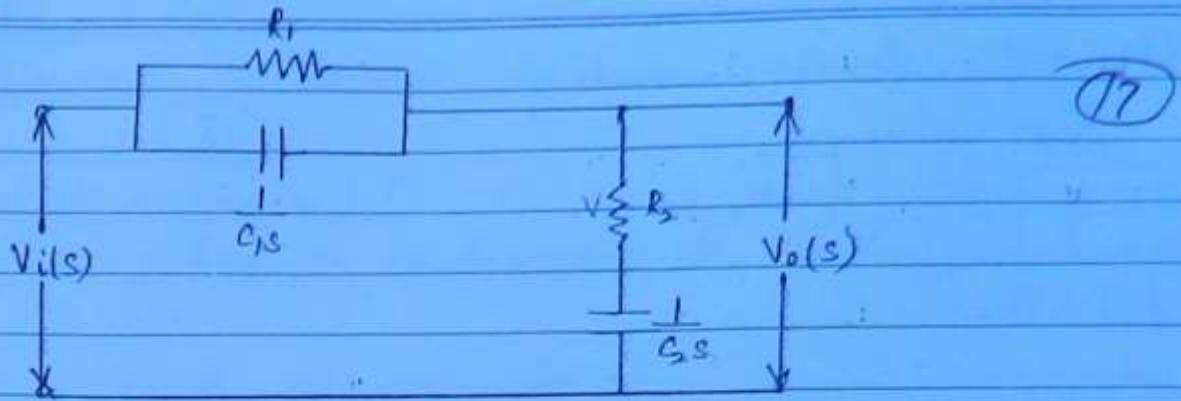

$$V_o(s) = \frac{1}{1 + \beta T s}$$

NOTE → If a pole is added to a system T.F in terms of compensation, it represents a LAG compensator.

### III LEAD LAG (a) LAG-LEAD compensators

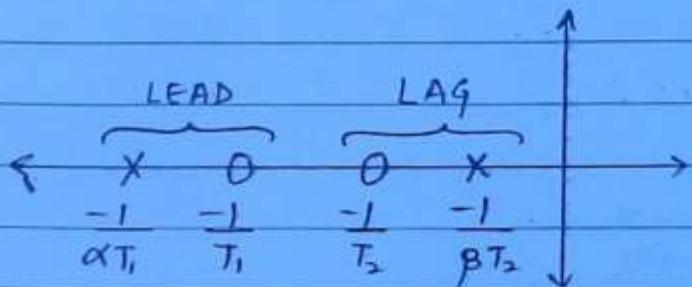

- It is used for improving both transient & steady state response characteristics
- It exhibits both LEAD & LAG characteristics in its frequency response

$$V_o(s) = \alpha(1 + T_1 s) (1 + T_2 s)$$

$$V_i(s) = (1 + \alpha T_1 s) (1 + \beta T_2 s)$$

$$T_1 = R_1 C_1 \quad / \quad T_2 = R_2 C_2$$

### MECHANICAL SYSTEMS -

All mechanical systems are classified into two types -

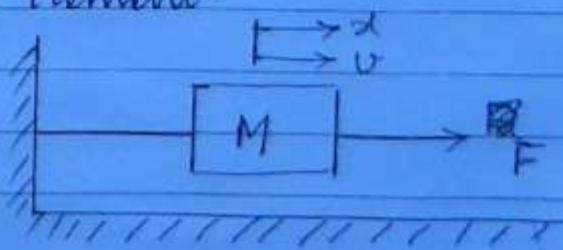

#### I. Mechanical Translational Systems -

Input = Force (F)

Output = Linear displacement (x) or. Linear Velocity (v)

The 3 ideal elements are -

#### I. Mass Element

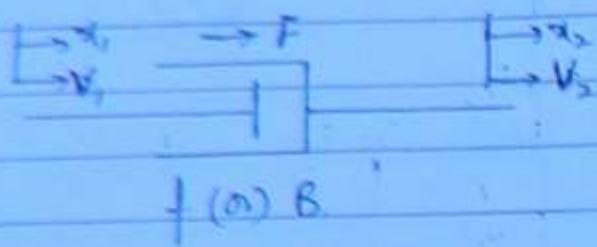

$$F = M \frac{dv}{dt}$$

$$F = M \frac{d^2x}{dt^2}$$

## 2. Damping Element (Friction)

(18)

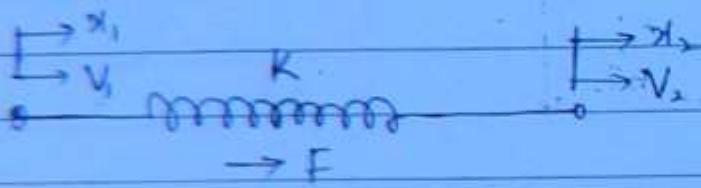

$$F = f(V_1 - V_2) = fV \quad (V = V_1 - V_2)$$

$$F = f \frac{d(x_1 - x_2)}{dt} = f \frac{dx}{dt}$$

$$(x = x_1 - x_2)$$

## 3. Spring Element (Stiffness)

$$F = k \int (V_1 - V_2) dt = k \int V dt \quad (V = V_1 - V_2)$$

$$F = k(x_1 - x_2) = kx \quad (x = x_1 - x_2)$$

## II Mechanical Rotational System

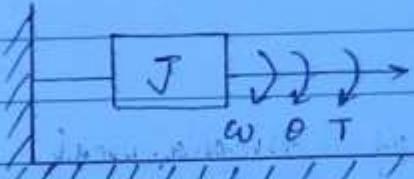

(79)

Input = Torque ( $T$ )

Output = Angular displacement ( $\theta$ ) (or) Angular Velocity ( $\omega$ )

The 3 ideal elements are -

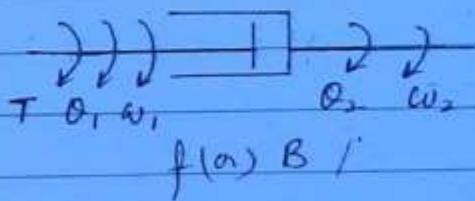

1. Inertia Element.

$$T = J \frac{d\omega}{dt}$$

$$T = J \frac{d^2\theta}{dt^2}$$

2. Torsional Damper Element (Friction)

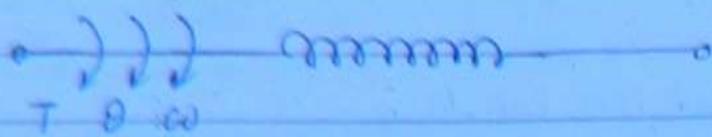

$$T = f(\omega_1 - \omega_2) = f\omega$$
$$(\omega = \omega_1 - \omega_2)$$

$$T = f \frac{d}{dt} (\theta_1 - \theta_2) = f \frac{d\theta}{dt}$$

$$(\theta = \theta_1 - \theta_2)$$

### 3 Torsional Spring Element (Stiffness)

(20)

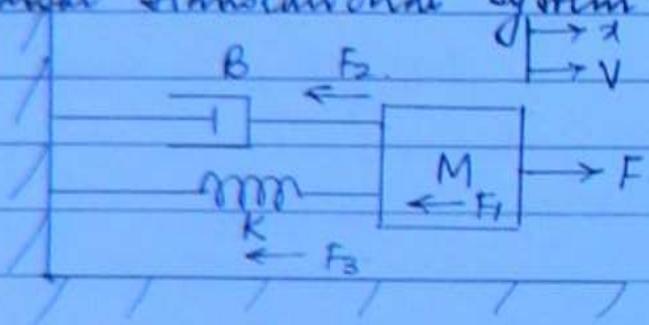

$$T = k \int w \, dt$$

$$T = k \theta$$

#### ANALOGOUS SYSTEMS -

The electrical equivalents of mechanical elements are known as analogous systems.

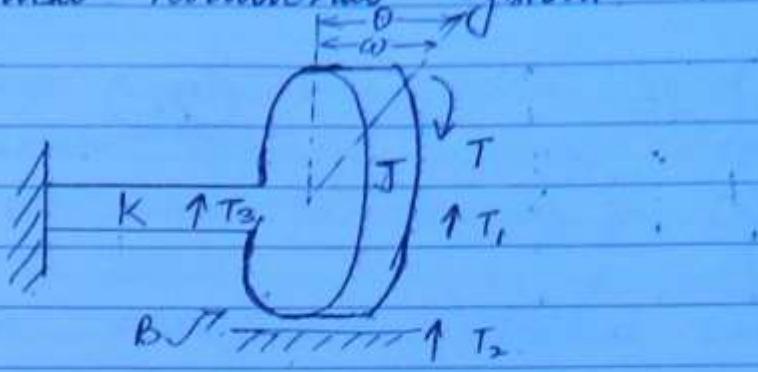

#### I. Mechanical Translational System

$$F = F_1 + F_2 + F_3$$

$$\left. \begin{aligned} F &= M \frac{dV}{dt} + BV + K \int V \, dt \\ F &= M \frac{d^2x}{dt^2} + B \frac{dx}{dt} + Kx \end{aligned} \right] \quad (1)$$

## II. Mechanical Rotational System

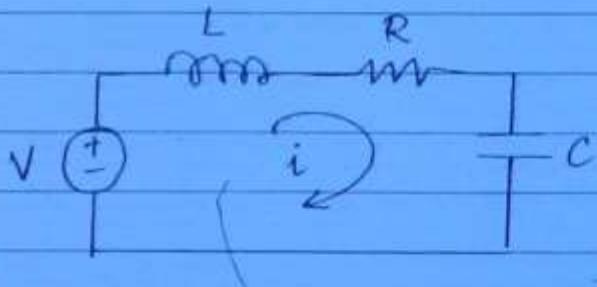

(21)

$$T = T_1 + T_2 + T_3$$

$$T = \frac{Jd\omega}{dt} + B\omega + K\int \omega dt \quad ] \quad (2)$$

$$T = \frac{Jd^2\theta}{dt^2} + \frac{Bd\theta}{dt} + K\theta \quad ]$$

## III Electrical System

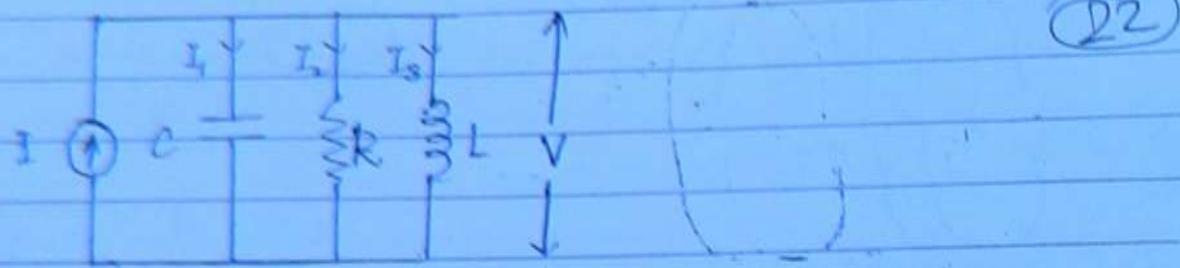

$$V = V_1 + V_2 + V_3$$

$$V = \frac{Ldi}{dt} + Ri + \frac{1}{C} \int i dt \quad [i = \frac{dq}{dt} \quad (q = \text{charge})] \quad (3)$$

$$V = \frac{Ld^2q}{dt^2} + \frac{Rdq}{dt} + \frac{1}{C}q \quad ]$$

## IV Electrical Systems -

$$I = I_1 + I_2 + I_3$$

$$I = C \frac{dv}{dt} + \frac{v}{R} + \frac{1}{L} \int v dt$$

$$v = \frac{d\phi}{dt} \quad \phi = \text{flux}$$

$$I = C \frac{d^2\phi}{dt^2} + \frac{1}{R} \frac{d\phi}{dt} + \frac{\phi}{L}$$

- (4)

Comparing (1)  $\rightarrow$  (4)

1 F - T - V - Analogy

2 F - T - I - Analogy

Mass/Inertia element & spring element are known  
as "CONSERVATIVE ELEMENTS"

$$F - T - V - I$$

$$M - J - L - C$$

$$B - B - R - 1/R$$

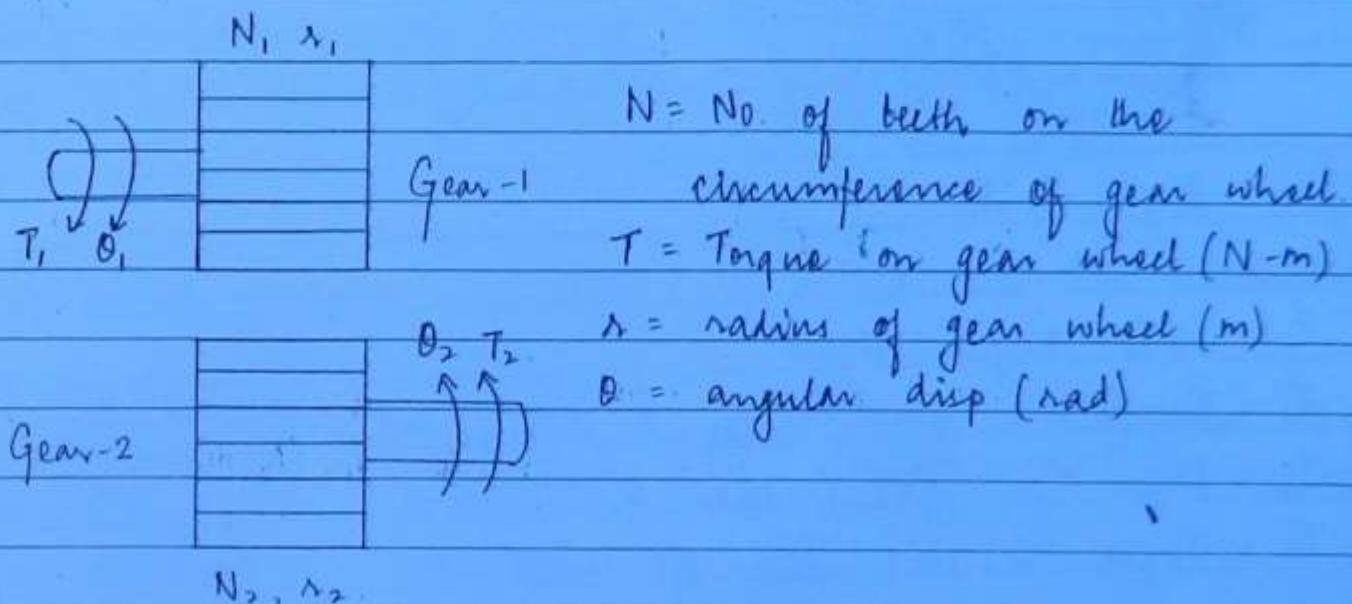

$$K - K - 1/C - 1/L$$

$$V - w - i - V$$

$$\alpha - \theta - q - \phi$$

## GEARS -

- \* Gears are mechanical devices which are used as intermediate elements between electrical motor & load.
- \* They are used for stepping up / stepping down either torque or speed.
- \* They are analogous to electrical transformers.

$N$  = No. of teeth on the circumference of gear wheel

$T$  = Torque on gear wheel (N-m)

$r$  = radius of gear wheel (m)

$\theta$  = angular disp (rad)

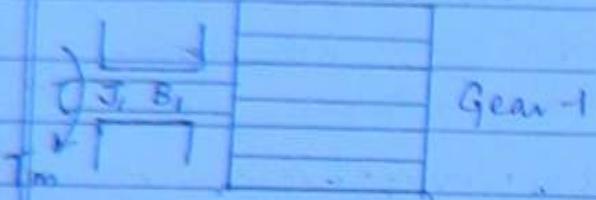

$$\frac{N_1}{N_2} = \frac{T_1}{T_2} = \frac{r_1}{r_2} = \frac{\theta_2}{\theta_1} = \frac{\omega_2}{\omega_1} = \frac{\alpha_2}{\alpha_1}$$

For 'n' gear wheels -

$$\boxed{\frac{N_x}{N_y} = \frac{T_x}{T_y} = \frac{r_x}{r_y} = \frac{\theta_y}{\theta_x} = \frac{\omega_y}{\omega_x} = \frac{\alpha_y}{\alpha_x}}$$

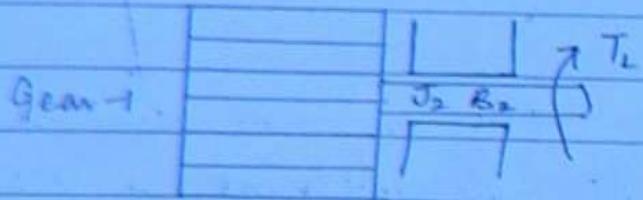

# Dynamics of Gear connected b/w Motor & Load -

$N_1, \alpha_1, T_1, \theta_1$

(24)

Gear-1

$N_2, \alpha_2, T_2, \theta_2$

$T_m$  = Motor torque ( $N\cdot m$ )

$T_1$  = Torque on gear-1 due to  $T_m$  ( $N\cdot m$ )

$T_2$  = Torque on gear-2 due to  $T_1$  ( $N\cdot m$ )

$T_L$  = Torque on load due to  $T_2$  ( $N\cdot m$ )

$$T_m = J_1 \frac{d^2\theta_1}{dt^2} + B_1 \frac{d\theta_1}{dt} + T_1$$

$$T_2 = J_2 \frac{d^2\theta_2}{dt^2} + B_2 \frac{d\theta_2}{dt} + T_L$$

$$\frac{N_1}{N_2} = \frac{T_1}{T_2} \Rightarrow T_L = \left(\frac{N_1}{N_2}\right) T_2$$

$$T_m = J_1 \frac{d^2\theta_1}{dt^2} + B_1 \frac{d\theta_1}{dt} + \left(\frac{N_1}{N_2}\right) J_2 \frac{d^2\theta_2}{dt^2} + \left(\frac{N_1}{N_2}\right) B_2 \frac{d\theta_2}{dt} + T_L \left(\frac{N_1}{N_2}\right) T_2$$

$$\frac{N_1}{N_2} = \frac{\theta_2}{\theta_1} = \frac{\dot{\theta}_2}{\dot{\theta}_1} = \frac{\ddot{\theta}_2}{\ddot{\theta}_1} \Rightarrow \ddot{\theta}_2 = \left(\frac{N_1}{N_2}\right) \ddot{\theta}_1 \quad \text{or} \quad \ddot{\theta}_1 = \left(\frac{N_2}{N_1}\right) \ddot{\theta}_2$$

$$\Rightarrow \dot{\theta}_2 = \left(\frac{N_1}{N_2}\right) \dot{\theta}_1 \quad \text{or} \quad \dot{\theta}_1 = \left(\frac{N_2}{N_1}\right) \dot{\theta}_2$$

## I Equivalent Inertia & Friction for Motor Side Gear (Gear -1)

$$T_M = \frac{J_1 d^2\theta_1}{dt^2} + B_1 \frac{d\theta_1}{dt} + \left(\frac{N_1}{N_2}\right)^2 J_2 \frac{d^2\theta_1}{dt^2} + \left(\frac{N_1}{N_2}\right)^2 B_2 \frac{d\theta_1}{dt} + \left(\frac{N_1}{N_2}\right) T_L \quad (25)$$

$$T_M = \left[ J_1 + \left(\frac{N_1}{N_2}\right)^2 J_2 \right] \frac{d^2\theta_1}{dt^2} + \left[ B_1 + \left(\frac{N_1}{N_2}\right)^2 B_2 \right] \frac{d\theta_1}{dt} + \left(\frac{N_1}{N_2}\right) T_L$$

$$J_{eq_1} = J_1 + \left(\frac{N_1}{N_2}\right)^2 J_2$$

$$B_{eq_1} = B_1 + \left(\frac{N_1}{N_2}\right)^2 B_2$$

## II Equivalent Inertia & Friction for Load Side Gear (Gear -2)

$$T_M = \left(\frac{N_2}{N_1}\right) J_1 \frac{d^2\theta_2}{dt^2} + \left(\frac{N_2}{N_1}\right) B_1 \frac{d\theta_2}{dt} + \left(\frac{N_1}{N_2}\right) J_2 \frac{d^2\theta_2}{dt^2} + \left(\frac{N_1}{N_2}\right) B_2 \frac{d\theta_2}{dt} + \left(\frac{N_1}{N_2}\right) T_L$$

multiplying both sides by  $\frac{N_2}{N_1}$

$$\frac{N_2}{N_1} T_M = \left(\frac{N_2}{N_1}\right)^2 J_1 \frac{d^2\theta_2}{dt^2} + \left(\frac{N_2}{N_1}\right)^2 B_1 \frac{d\theta_2}{dt} + \left(\frac{N_1}{N_2}\right) J_2 \frac{d^2\theta_2}{dt^2} + B_2 \frac{d\theta_2}{dt} + T_L$$

$$\frac{N_2}{N_1} T_M = \left[ \left(\frac{N_2}{N_1}\right)^2 J_1 + J_2 \int \frac{d^2\theta_2}{dt^2} \left[ \left(\frac{N_2}{N_1}\right)^2 B_1 + B_2 \right] \frac{d\theta_2}{dt} \right] + T_L$$

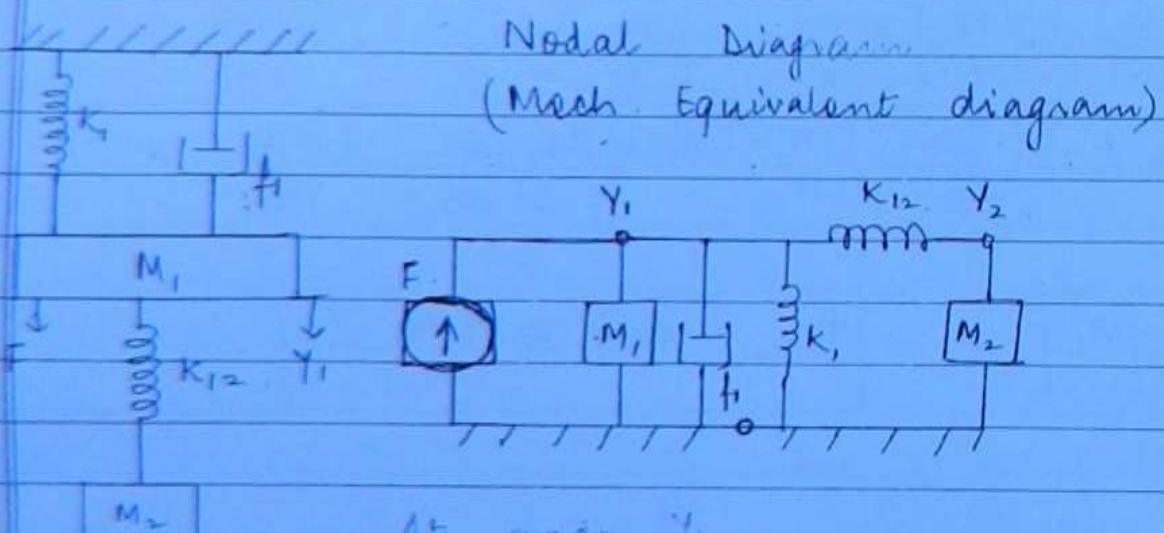

$$J_{eq_2} = J_2 + \left(\frac{N_2}{N_1}\right)^2 J_1$$

$$B_{eq_2} = B_2 + B_1 \left(\frac{N_2}{N_1}\right)^2$$

## NODAL METHOD -

(26)

- \* No. of nodes = No. of displacements
- \* Take an additional node which is a reference node.
- \* Connect mass or inertial mass elements between the principal node and reference only.
- \* Connect the spring and damping elements either between the principal nodes or between principal node & reference depending on their position.
- \* Obtain the nodal diagram & write the describing differential equations at each node.

Let's write  $y_1$

$$F = M_1 \frac{d^2 y_1}{dt^2} + f_1 \frac{dy_1}{dt} + K_1 y_1 + K_{12} (y_1 - y_2)$$

$f_1 = -\omega_1^2$

$$0 = M_2 \frac{d^2 y_2}{dt^2} + K_{12} (y_2 - y_1)$$

Transfer function  $\frac{Y_1(s)}{F(s)}$

(27)

$$F(s) = (M_1 s^2 + f_1 s + k_1 + K_{12}) Y_1(s) - K_{12} Y_2(s)$$

$$0 = (M_2 s^2 + k_{12}) Y_2(s) - K_{12} Y_1(s)$$

$$Y_2(s) = \begin{bmatrix} K_{12} \\ M_2 s^2 + k_{12} \end{bmatrix} Y_1(s)$$

$$F(s) = \left\{ (M_1 s^2 + f_1 s + k_1 + K_{12}) - \frac{K_{12}^2}{M_2 s^2 + k_{12}} \right\} Y_1(s)$$

$$F(s) = \left\{ (M_1 s^2 + f_1 s + k_1 + K_{12})(M_2 s^2 + k_{12}) - K_{12}^2 \right\} \frac{Y_1(s)}{M_2 s^2 + k_{12}}$$

$$Y_1(s) = \frac{M_2 s^2 + k_{12}}{(M_1 s^2 + f_1 s + k_1 + K_{12})(M_2 s^2 + k_{12}) - K_{12}^2}$$

### SIGNAL FLOW GRAPH for CLCS -

It's a graphical representation of control system in which nodes representing each of the system variables are connected by direct branches.

### TERMINOLOGY OF SFG'S.

#### 1. NODE -

It represents a system variable  $f$  is equal to the sum of all incoming signals at it.

#### 2. INPUT NODE or SOURCE NODE -

It's a node having only outgoing branches.

#### 3. OUTPUT NODE or SINK NODE -

It's a node having only incoming branches.

#### 4. MIXED or CHAIN NODE -

It's a node having both incoming & outgoing branches.

#### 5. PATH -

It is the traversal of the connected branches in the direction of branch arrow such that no node is traversed more than once.

## 6. FORWARD PATH -

It's a path from input node to output node

## 7. LOOP -

It's a path which originates & terminates at the same node

Self loop at defined input is not considered valid

Self loop at ~~not~~ defined output node is valid  
cuz output node can be extended

## NOTE -

Self loops on defined input nodes are not valid loops.

Self loops / loops on output nodes are valid loops

## 8. NON TOUCHING LOOPS -

Two or more loops are said to be non-touching if they do not have a common node

## MASON'S GAIN FORMULA -

$$\text{The overall gain or T.F} = \frac{\sum P_k \Delta_k}{\Delta}$$

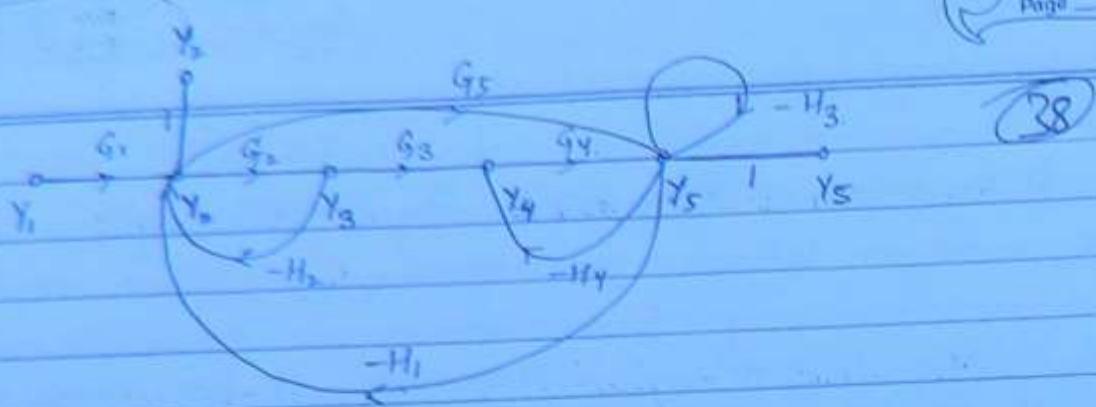

$$= P_1 \Delta_1 + P_2 \Delta_2 + \dots + P_k \Delta_k$$

where

$P_k$  = Path gain of  $k^{\text{th}}$  forward path

Relationship between static & dynamic error constants

$$G(s)H(s) = \frac{100}{s(s+2)}$$

(58)

I. Static Error Constants -

$$K_p = \lim_{s \rightarrow 0} \frac{100}{s(s+2)} = \infty$$

$$K_v = \lim_{s \rightarrow 0} s \cdot \frac{100}{s(s+2)} = 50$$

$$K_A = \lim_{s \rightarrow 0} s^2 \frac{100}{s(s+2)} = 0$$

II. Dynamic Error Constants -

$$F(s) = \frac{1}{1 + G(s)H(s)} = \frac{1}{1 + \frac{100}{s(s+2)}}$$

$$K_o = \lim_{s \rightarrow 0} F(s) = \lim_{s \rightarrow 0} \frac{1}{1 + \frac{100}{s(s+2)}} = \frac{1}{1 + \infty} = 0$$

$$\boxed{K_o = \frac{1}{1 + K_p}}$$

$$K_i = \lim_{s \rightarrow 0} \frac{d}{ds} F(s)$$

$$\frac{d}{ds} F(s) = \frac{d}{ds} \frac{1}{1 + \frac{100}{s(s+2)}} = \frac{d}{ds} \left[ \frac{s(s+2)}{s^2 + 2s + 100} \right]$$

$$= \frac{(s^2 + 2s + 100)(2s+2) - s(s+2)(2s+2)}{(s^2 + 2s + 100)^2}$$

$$K_1 = \lim_{s \rightarrow 0} \frac{d}{ds} F(s)$$

(59)

$$= \frac{100(2) - 0}{(0+0+100)^2} = \frac{200}{100 \times 100} = \frac{1}{50}$$

$$K_1 = \frac{1}{K_V}$$

$$K_2 = \frac{1}{K_A}$$

Static & Dynamic error constants  
need not always be direct reciprocal values.

Q. Find ess for  $\eta(t) = 5 + 2t$

1. Error Series -

$$ess = \lim_{t \rightarrow \infty} [K_0 \eta(t) + K_1 \dot{\eta}(t) + K_2 \ddot{\eta}(t) + \dots]$$

$$\eta(t) = 5 + 2t \Rightarrow K_0 = 0$$

$$\dot{\eta}(t) = 2 \Rightarrow K_1 = \frac{1}{50}$$

$$\ddot{\eta}(t) = 0$$

$$ess = \lim_{t \rightarrow \infty} [0 \times (5 + 2t) + \frac{1 \times 2}{50}]$$

$$ess = \frac{2}{50} \text{ units.}$$

2. Error Ratio

$$ess = \lim_{s \rightarrow 0} \frac{s \cdot R(s)}{1 + G(s) H(s)}$$

$$\eta(t) = 5 + 2t$$

$$R(s) = \frac{5}{s} + \frac{2}{s^2} = \frac{5s+2}{s^2}$$

$$e_{ss} = \lim_{s \rightarrow 0} s \cdot \frac{5s+2}{s^2}$$

(6)

$$1 + \frac{100}{s(s+2)}$$

$$e_{ss} = \lim_{s \rightarrow 0} \frac{5s+2}{s + \cancel{s} \cdot 100} = \frac{2}{50} \text{ units}$$

### 3. Short cut method

$$r(t) = 5 + 2t$$

$$R(s) = \frac{5}{s} + \frac{2}{s^2}$$

$$G(s) = \frac{100}{s(s+2)}$$

$$e_{ss} = D + \frac{A}{k}$$

$$A = 2$$

$$e_{ss} = 2 \text{ units}$$

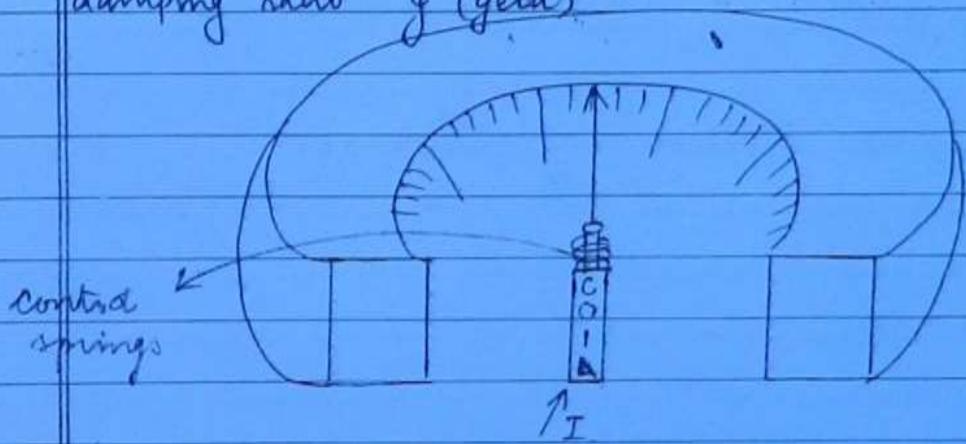

## TRANSIENT STATE ANALYSIS -

(G)

It deals with the nature of response of a system & depends on the order of the system.

The response of a 2<sup>nd</sup> order or higher order system exhibits continuous & sustained oscillations about the steady state value of input with a frequency known as undamped natural frequency  $\omega_n$  rad/s.

Those oscillations in the response are damped to the steady state value of input using appropriate damping methods with damping expressed mathematically as the damping ratio  $\zeta$  (beta).

Input = Deflecting torque ( $T_d$ )

Output = Angular deflection of pointer ( $\theta$ )

$J, B, K$

$$T_d = J \frac{d^2\theta}{dt^2} + B \frac{d\theta}{dt} + K\theta$$

$$T_d(s) = (Js^2 + Bs + K)\theta(s)$$

$$\frac{\theta(s)}{T_d(s)} = \frac{1}{Js^2 + Bs + K} = \frac{s^2 + \frac{B}{J}s + \frac{K}{J}}{s^2 + \frac{B}{J}s + \frac{K}{J}}$$

$$s^2 + \frac{B}{J}s + \frac{K}{J} = s^2 + 2\zeta\omega_n s + \omega_n^2$$

$$\omega_n = \sqrt{\frac{K}{J}} \text{ rad/s}$$

(62)

$$2G\sqrt{\frac{K}{J}} = \frac{B}{J} \Rightarrow \boxed{g = \frac{B}{2\sqrt{KJ}}} \\ g \propto B.$$

Undamped Natural frequency  $\omega_n$  rad/s.

$\therefore$  Damping Ratio  $\zeta$  [Gebet]

$$\frac{C(s)}{R(s)} = \frac{\omega_n^2}{s^2 + 2G\omega_n s + \omega_n^2}$$

Effect of Damping on Nature of Response -

$$\frac{C(s)}{R(s)} = \frac{\omega_n^2}{s^2 + 2G\omega_n s + \omega_n^2}$$

$$\begin{aligned} s^2 + 2G\omega_n s + \omega_n^2 &= 0 \\ &= -2G\omega_n s \pm \sqrt{4G^2\omega_n^2 - 4\omega_n^2} \\ &= -G\omega_n \pm \omega_n \sqrt{G^2 - 1} \end{aligned}$$

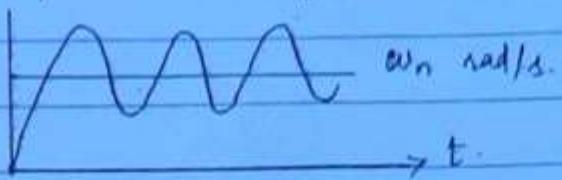

$$D = G^2 - 1 = 0 \Rightarrow \zeta = 1$$

$$D = G^2 - 1 < 0 \Rightarrow \zeta < 1$$

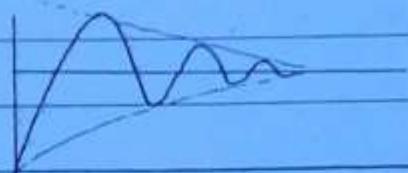

$$D = G^2 - 1 > 0 \Rightarrow \zeta > 1$$

case 1  $\Rightarrow$  Undamped case ( $\zeta = 0$ )

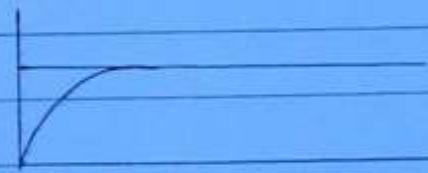

(G3)

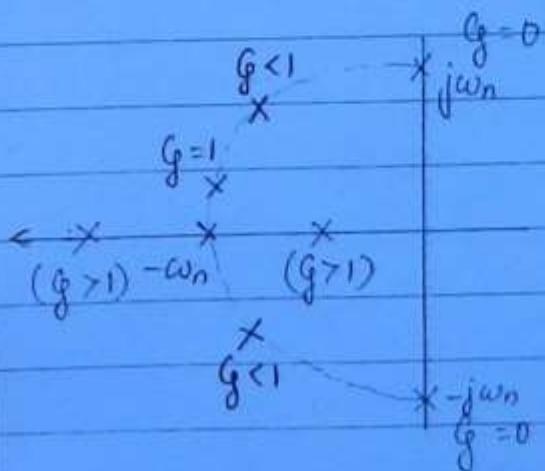

case 2  $\Rightarrow$  Underdamped case [ $0 < \zeta < 1$ ]

case 3  $\Rightarrow$  Critically damped case [ $\zeta = 1$ ]

case 4  $\Rightarrow$  Overdamped case [ $\zeta > 1$ ]

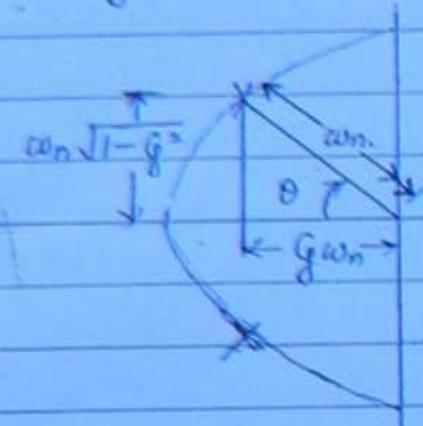

Most of the control systems are defined for  $\zeta < 1$  because the response can be analysed using more number of specifications

# STABILITY IN TIME DOMAIN

(81)

The stability of LTI system may be defined as when the system is subjected to bounded input the output should be bounded.

BIBO  $\rightarrow$  implies the impulse response of the system should tend to 0 as time approaches infinity. The stability of the system depends on roots of the characteristic equation  $1 + H(s)G(s) = 0$  ie closed loop poles.

C.L. Pole locations	Stability criteria	Impulse Response

## Stereotypes for control problems

(89)

Difficulty - 3 -

Relative stability analysis using Routh array is not feasible for higher order polynomials because it involves shifting of origin of  $s$ -plane more negatively.

Shortcut

Substitute the given pt. (eg  $s+1=0$  means  $s=-1$ )

in the polynomial assuming the pt makes it stable

→ If LHS  $> 0$  all roots lie on the LS of  $s$ -plane

→ If LHS = 0 one root lies on the shifted axis line & rest of the roots to the left.

e.g. in prev ques  $s=-1$  in  $P(s)$

gives 00

∴ All 3 roots lie on LS of  $s$ -plane

## ROOT LOCUS

(94)

The root locus is defined as locus of closed loop poles obtained when system gain  $K$  is varied from 0 to  $\infty$ . It determines the relative stability of the system w.r.t. variations in system gain  $K$ .

### Angle & Magnitude Conditions

Angle condition  $\rightarrow$  is used for checking whether any point is lying on root locus or not. If also the validity of root locus shape for closed loop poles.

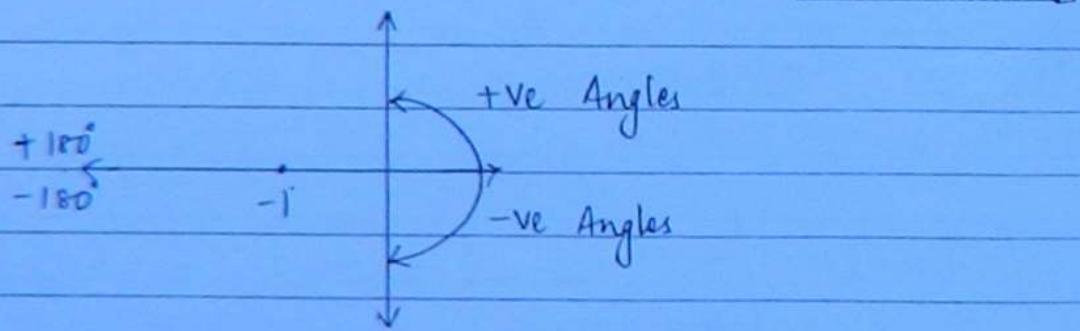

In negative feedback systems

$$1 + G(s) H(s) = 0$$

$$G(s) H(s) = -1$$

$$= -1 + 0j$$

$$= 180^\circ - \tan^{-1} \left[ \frac{0}{1} \right] = 180^\circ \approx \pm 180^\circ \\ \approx [2q+1] 180^\circ$$

Angle condition may be stated as, for a point to lie on root locus, the angle evaluated at that point must be an odd multiple of  $\pm 180^\circ$

Magnitude condition  $\rightarrow$  is used for finding the magnitude of system gain  $K$  at any point on the root locus.

### CONSTRUCTION RULES OF ROOT LOCUS -

Rule 1 → The root locus is symmetrical about real axis ( $G(s)H(s) = -1$ )

Rule 2 → Let

$$P = \text{no. of open loop poles}$$

$$Z = \text{no. of open loop zeros}$$

$$\text{and } P > Z$$

Then,

$$\text{No. of branches of RL} = P$$

$$\text{No. of branches terminating at zeros} = Z$$

$$\text{No. of branches terminating at infinity} = P - Z$$

we assume there's a zero at infinity.

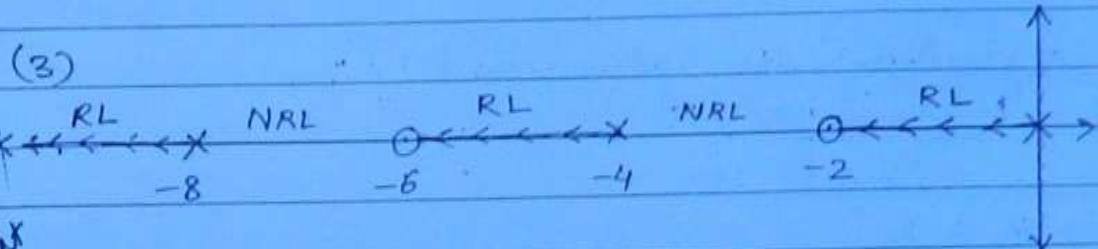

Rule 3 → A point on real axis is said to be

on root locus if to the right side of this point the sum of open loop poles and zeros is odd

eg.  $G(s) = \frac{k(s+2)(s+6)}{s(s+4)(s+8)}$

(Q7)

(2) :  $P = 3$        $Z = 2$        $P - Z = 1$

Closed Loop T.F.

$G(s) = \frac{k(s+2)(s+6)}{s(s+4)(s+8)}$

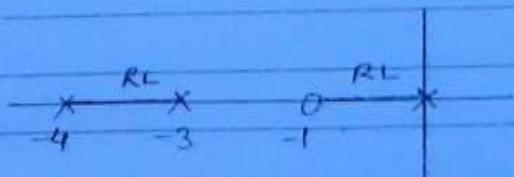

$$\frac{1 + G(s)}{1 + \frac{k(s+2)(s+6)}{s(s+4)(s+8)}} = \frac{s(s+4)(s+8) + k(s+2)(s+6)}{s(s+4)(s+8) + k(s+2)(s+6)}$$

$$= \frac{k(s+2)(s+6)}{s(s+4)(s+8) + k(s+2)(s+6)}$$

C.L. poles =  $s(s+4)(s+8) + k(s+2)(s+6) = 0$   
when  $k = 0$

C.L. poles = 0, -4, -8

(5)

(c)

Rule 4 → Angle of Asymptotes

(98)

The P-Z branches will terminate at infinity along certain straight lines known as asymptotes of root locus. Therefore, number of asymptotes = P-Z

Angle of asymptotes is given by :

$$\theta = \frac{[2q+1]180^\circ}{P-Z}$$

$$q = 0, 1, 2, 3, \dots$$

e.g.

$$P-Z = 2$$

$$\theta_1 = \frac{[2(0)+1]180^\circ}{2} = 90^\circ$$

$$\theta_2 = \frac{[2(1)+1]180^\circ}{2} = 270^\circ$$

(12)

$$\underbrace{s(s+4)(s^2+2s+1)}_{1+K(s+1)} + K(s+1) = 0$$

$$1+K(s+1) = 0$$

$$s(s+4)(s^2+2s+1)$$

$$1+G(s)H(s) = 0$$

$$G(s)H(s) = \frac{K(s+1)}{s(s+4)(s^2+2s+1)}$$

$$P=4 \quad Z=1 \quad P-Z=3$$

$$\theta_1 = \frac{[2(0)+1]180^\circ}{3} = 60^\circ \quad \leftarrow \quad \rightarrow \quad \frac{2\pi}{P-Z} = \frac{2\pi}{3} = \underline{120^\circ}$$

$$\theta_2 = \frac{[2(1)+1]180^\circ}{3} = 180^\circ \quad \leftarrow \quad \rightarrow$$

$$\theta_3 = \frac{[2(2)+1]180^\circ}{3} = 300^\circ \quad \leftarrow$$

Rule 5  $\rightarrow$  Centroid

(99)

It is the intersection point of asymptotes on the real axis. It may or may not be a part of RL.

$$\text{Centroid} = \sum \text{Real part of open loop poles} - \sum \text{Real part of open loop zeros}$$

$P - Z$

(10)

$$s^3 + 5s^2 + (k+6)s + k = 0$$

$$s^3 + 5s^2 + sk + 6c + k = 0$$

$$\underbrace{s^3 + 5s^2 + 6s}_{(s+3)(s^2+6)} + k(s+1) = 0$$

$$1 + \frac{k(s+1)}{s^3 + 5s^2 + 6s} = 0$$

$$1 + G(s)H(s) = 0$$

$$G(s)H(s) = \frac{k(s+1)}{s^3 + 5s^2 + 6s} = \frac{k(s+1)}{s(s^2 + 5s + 6)} = \frac{k(s+1)}{s(s+3)(s+2)}$$

$$\text{Poles} = 0 + j0$$

$$-1, -2 + j0$$

$$-3 + j0$$

$$-5$$

$$\text{Zeros} = \frac{-1 + j0}{-1}$$

$$P = 3 \quad Z = 1$$

$$P - Z = 2$$

$$\text{Centroid} = \frac{-5 - (-1)}{2} = -2 = [-2, 0] \text{ (C)}$$

## Rule 6 → Break Away Points

(100)

They are those points where multiple roots of the characteristic equation occur.

Procedure -

1. Construct  $1 + G(s)H(s) = 0$
2. Write K in terms of s
3. Find  $\frac{dk}{ds} = 0$
4. The roots of  $\frac{dk}{ds} = 0$  will give B.A. points
5. To test valid B.A. points substitute in step (2)  
If  $k = +ve \rightarrow$  Valid B.A. point.

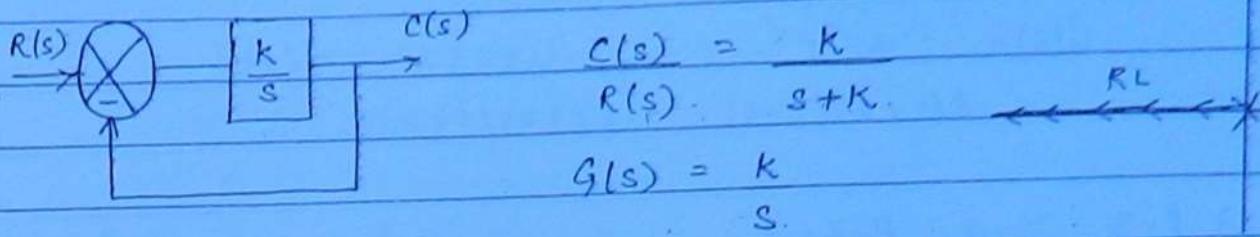

General Predictions about B.A. points -

1. The branches of RL either approach or leave the B.A. points at an angle of  $\pm 180^\circ$  where n = no. of branches approaching or leaving B.A. point.
2. The complex conjugate path for the branches of RL approaching or leaving the B.A. point is a circle
3. Whenever there are 2 adjacently placed poles on the real axis with the section of real axis between them as a part of RL, then there exists a breakaway point between the adjacently placed poles

(4)

Damping can be determined by  $\zeta$  value or location of poles

→ If poles are on  $\text{Im}\ z$  axis → undamped

→ If poles are on ~~real axis of~~  $s$  plane of repeating → critically damped

→ If poles are in 2nd or 3rd quad of  $s$  plane → underdamped

→ If poles are on real axis of unequal → overdamped

for  $0 \leq k < 1$  → poles are on real axis of unequal

At  $k=1$  → poles repeated → marginally stable

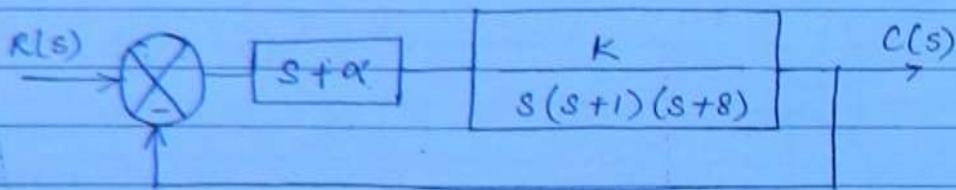

$k > 1$  → pole on real axis of unequal

Ans (c) Since equality cannot here equal to hence option (d) is incorrect

## ROOT CONTOURS

(120)

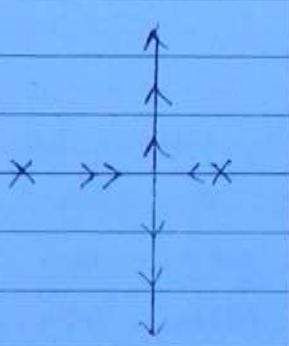

Root contours are multiple root locus diagrams obtained by varying multiple parameters in a Transfer function drawn on same s-plane.

$$G(s) = \frac{K(s+a)}{s(s+1)(s+8)}$$

Case 1 → Let  $a = 0$

$$\begin{aligned} G(s) &= \frac{Ks}{s(s+1)(s+8)} \\ &= \frac{K}{(s+1)(s+8)} \end{aligned}$$

$$\text{Case 2} \rightarrow 1 + \frac{Ks + K\alpha}{s(s+1)(s+8)} = 0$$

Q Find B.A pts for  $k=10$  ?

(121)

Sol.  $G(s)H(s) = \frac{10\alpha}{s(s+1)(s+8)+10s}$

Let  $10\alpha = k'$

$$= \frac{k'}{s(s^2 + 9s + 18)}$$

$$1 + G(s)H(s) = 0$$

$$1 + \frac{k'}{s(s^2 + 9s + 18)} = 0$$

$$s^3 + 9s^2 + 18s + k' = 0$$

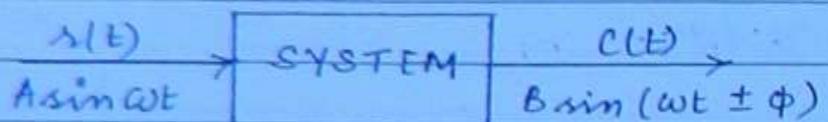

$$k' = -s^3 - 9s^2 - 18s$$

$$\frac{dk'}{ds} = 0 \Rightarrow 3s^2 + 18s + 18 = 0$$

## FREQUENCY DOMAIN ANALYSIS

(122)

When any system is subjected to sinusoidal input, the output is also sinusoidal having different magnitude & phase angle but same input frequency  $\omega$  rad/sec.

Frequency response analysis implies varying  $\omega$  from  $0$  to  $\infty$  & observing corresponding variations in the magnitude & phase angle of the response.

$$\text{Let } F(s) = \frac{C(s)}{R(s)} = T.F.$$

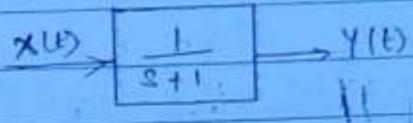

$$\text{Put } s = j\omega$$

$F(j\omega)$  = Sinusoidal T.F.  
 ≈ Sinusoidal response

$$F(j\omega) = |F(j\omega)| / \angle F(j\omega)$$

$$\sqrt{(r.p)^2 + (i.p)^2} \quad \tan^{-1} \left[ \frac{i.p}{r.p} \right]$$

(20)

For  $X(t) = \sin t$  find  $Y(t)$ .

$$F(s) = \frac{Y(s)}{X(s)} = \frac{1}{s+1}$$

$$F(j\omega) = \frac{1+j0}{1+j\omega}$$

$$|F(j\omega)| = \sqrt{1^2 + 0^2} = \frac{1}{\sqrt{1+\omega^2}}$$

$$\angle F(j\omega) = \frac{\tan^{-1} 0}{1} = -\tan^{-1}\omega$$

$$F(j\omega) = \frac{1}{\sqrt{1+\omega^2}} e^{-j\tan^{-1}\omega}$$

Given  $X(t) = \sin t$ 

$$\approx \sin \omega t \Rightarrow \omega = 1 \text{ rad/s}$$

$$F(j\omega) = \frac{1}{\sqrt{2}} e^{-j45^\circ}$$

$$Y(t) = \frac{1}{\sqrt{2}} \sin(t - 45^\circ)$$

Q.

$$G(s) = \frac{(s^2+9)(s+2)}{(s+3)(s+5)(s+7)}$$

### FREQUENCY DOMAIN SPECIFICATIONS-

Resonant frequency (w<sub>r</sub>)

It is the frequency at which magnitude of  $F(j\omega)$  has maximum value.

$$\omega_r = \omega_n \sqrt{1-2g^2} \text{ r/s}$$

It is correlated with

$$\omega_d = \omega_n \sqrt{1-g^2} \text{ r/s}$$

For  $w_d$  to be Real & +ve

$$2g^2 < 1 \Rightarrow \boxed{g < \frac{1}{\sqrt{2}}}$$

For  $w_d$  to be Real & +ve

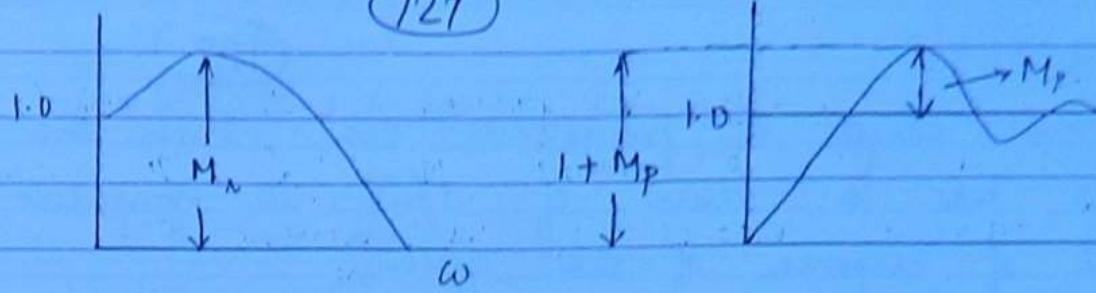

$$g^2 < 1 \Rightarrow \boxed{g < 1}$$

Resonant Peak (or) Peak Magnitude (M<sub>r</sub>)

It is the maximum value of magnitude occurring at resonant frequency  $w_r$ .

$$M_r = \boxed{1}$$

(27)

$$g < \frac{1}{\sqrt{2}}, \quad M_n > 1$$

$$g = \frac{1}{\sqrt{2}}, \quad M_n = 1$$

$$g > \frac{1}{\sqrt{2}} \quad \text{No } M_n$$

They have represented it as  $M_p$

### 3. Bandwidth (B.W) :

(128)

It is the range of frequencies over which the magnitude has a value of  $1/\sqrt{2}$ . It indicates the speed of response of the system.

Wider B.W  $\Rightarrow$  Faster response.

$$BW \propto \frac{1}{t_r} \quad \text{where } t_r = \text{rise time}$$

### 4. Cut-off Frequency ( $\omega_c$ )

It is the frequency at which the magnitude has a value of  $1/\sqrt{2}$ . It indicates the ability of the system to distinguish signal from noise.

$$BW (\omega_c) \quad \omega_c = \omega_n \sqrt{1 - 2G^2 + \sqrt{4G^4 - 4G^2 + 2}}$$

Frequency Domain Approximation of Dead Time or Transportation Lag -

$$F(s) = \frac{Y(s)}{X(s)} = e^{-Ts}$$

$$F(j\omega) = e^{-j\omega T} = \cos \omega T - j \sin \omega T$$

$$|F(j\omega)| = \sqrt{(\cos \omega T)^2 + (\sin \omega T)^2} = 1$$

Concept of Enclosure &amp; Encirclement:

A point is said to be enclosed by a contour if it lies to the right side of the direction of the contours.

(PST)

A point is said to be enclosed if the contour is a closed path.

In fig (2) pt y is said to be enclosed whereas point x is said to be enclosed in anticlockwise direction.

In Polar plots if the critical point  $-1+j0$  is not enclosed then the system is said to be stable.

Effect of adding zeros on the shape of Polar or Nyquist plots.

- For minimum phase or non-minimum phase functions of any type, when zeros are present check for intersection of polar plot with -ve real axis.
- For type 2 & type 3 standard open loop functions when zeros are added before the location of poles then the polar plot intersects the negative real axis as many times as there are zeros. dont consider poles at origin.

$$G(s) = \frac{10(1+s)}{s(1+0.2s)(1+0.1s)}$$

At  $\omega = 1$

$$Y = MX + C$$

$$-20 = -20 \log 1 + C$$

$$C = -20$$

(187)

$$G(s) = \frac{0.1 (1 + 10s)^3}{(1+s)^2 (1+0.1s)}$$

At  $\omega = 0.1$

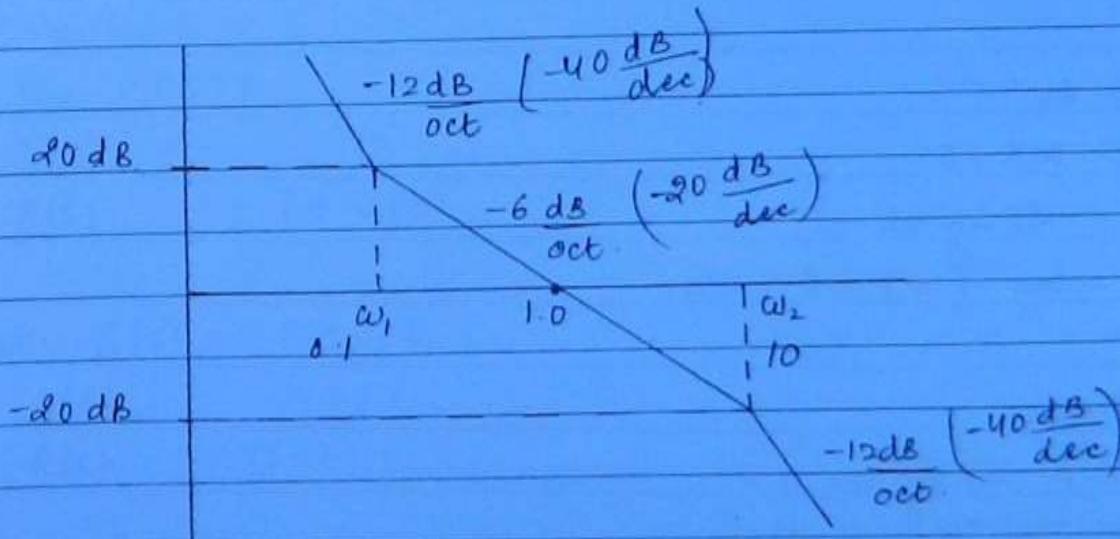

$$Y = MX + C$$

$$-20 = 0 \times \log 0.1 + C$$

$$C = -20$$

$$20 \log K = -20$$

$$K = 0.1$$

$$G(s) = \frac{0.1 (1 + 10s)}{s^2 (1 + 0.1s)}$$

## DECADE SCALE

$$\omega_2 = 10\omega_1$$

dB value =  $\pm \alpha_0 \times n \log \omega$   
Magnitude

$$\text{Slope (m)} = \pm \alpha_0 \times n \log 10 \\ = \pm \alpha_0 \times n \frac{\text{dB}}{\text{dec}}$$

## OCTAVE SCALE

$$\omega_2 = 2\omega_1$$

dB value =  $\pm \alpha_0 \times n \log \omega$   
magnitude

$$\text{Slope (m)} = \pm \alpha_0 \times n \log 2 \\ = \pm 6 \times n \frac{\text{dB}}{\text{oct}}$$

$$\pm 6 \times n \frac{\text{dB}}{\text{oct}} \approx \pm \alpha_0 \times n \frac{\text{dB}}{\text{dec}}$$

Second Line choose a line which passes through  
At  $\omega = 1$  a known frequency.

$$Y = MX + C$$

$$\theta_0 = -\alpha_0 \log 1 + C$$

$$C = 0$$

$$\text{At } \omega = \omega_1$$

$$Y = MX + C$$

$$\theta_0 = -\alpha_0 \log \omega_1 + C$$

$$\omega_1 = \log^{-1}(-1) = 0.1 \text{ rad/s}$$

$$\text{At } \omega = \omega_2$$

$$-\alpha_0 = -\alpha_0 \log \omega_2 + C$$

$$\omega_2 = \log^{-1}(1) = 10 \text{ rad/s}$$

First line

At  $\omega = \omega_1 = 0.1$

$$Y = MX + C$$

$$\vartheta_0 = -40 \log 0.1 + C$$

$$C = -\vartheta_0$$

$$\vartheta_0 \log K = -\vartheta_0$$

$$K = 0.1$$

## M & N CIRCLES

1. The nichol's chart gives information about closed loop frequency response of the system
2. It consists of magnitudes of phase angles of closed loop system represented as a family of circles known as M & N circles

### 3. M CIRCLES

Let the CLTF

$$\frac{C(s)}{R(s)} = \frac{G(s)}{1+G(s)}$$

$$\text{Let } G(s) = X + jY$$

$$\frac{C(s)}{R(s)} = \frac{X + jY}{(1+X) + jY}$$

The magnitude (M) -

$$M = \sqrt{X^2 + Y^2}$$

$$M^2 = \frac{X^2 + Y^2}{(1+X)^2 + Y^2}$$

(190)

$$M^2X^2 - X^2 + M^2Y^2 - Y^2 + 2XM^2 + M^2 = 0$$

$$X^2[M^2 - 1] + Y^2[M^2 - 1] + 2XM^2 + M^2 = 0 \quad \text{--- (1)}$$

In eq (1) if  $M = 1$   
 $\alpha X + 1 = 0$

→ it represents a st. line passing through  $-\frac{1}{2}, 0$ .

→ If  $M \neq 1$  eqn (1)  
represents a family of circles.

$$\frac{X^2 + Y^2 + \alpha X}{M^2 - 1} + \frac{M^2}{M^2 - 1} = 0$$

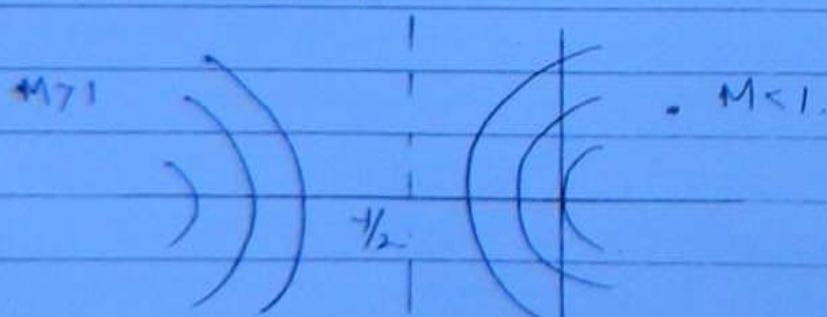

$$\frac{X^2 + Y^2 + 2XM^2}{M^2 - 1} + \frac{M^2}{M^2 - 1} + \frac{M^2}{(M^2 - 1)^2} = \frac{M^2}{(M^2 - 1)^2}$$

$$\frac{X^2 + 2XM^2}{M^2 - 1} + \frac{M^4}{(M^2 - 1)^2} + \frac{Y^2}{(M^2 - 1)^2} = \frac{M^2}{(M^2 - 1)^2}$$

$$\boxed{\left[ \frac{X + M^2}{M^2 - 1} \right]^2 + Y^2 = \frac{M^2}{(M^2 - 1)^2}}$$

$$\text{Centre} \rightarrow -\frac{M^2}{M^2 - 1}, 0$$

$$\text{Radius} \rightarrow \frac{M}{M^2 - 1}$$

## 4. N-circles

(19)

let  $\alpha \Rightarrow$  Phase angle of C.L. system. $N = \tan \alpha$  represents a family of circles

$$\alpha = \tan^{-1}\left(\frac{y}{x}\right) - \tan^{-1}\left(\frac{y}{1+x}\right)$$

$$N = \tan \alpha = \tan\left[\tan^{-1}\left(\frac{y}{x}\right) - \tan^{-1}\left(\frac{y}{1+x}\right)\right]$$

$$N = \underbrace{\frac{y}{x} - \frac{y}{1+x}}_{1 + \frac{y^2}{x(1+x)}} \Rightarrow \frac{x^2 + x + y^2 - y}{N} = 0$$

Adding term  $\frac{1}{4} + \left(\frac{1}{2N}\right)^2$  on b.s.

$$x^2 + x + \frac{1}{4} + y^2 - y + \left(\frac{1}{2N}\right)^2 = \frac{1}{4} + \left(\frac{1}{2N}\right)^2$$

$$\left[\frac{x+1}{2}\right]^2 + \left[\frac{y-1}{2N}\right]^2 = \frac{1}{4} + \left(\frac{1}{2N}\right)^2$$

$$\text{Centre} = -\frac{1}{2}, \frac{1}{2N}$$

$$\text{Radius} = \sqrt{\frac{1}{4} + \left(\frac{1}{2N}\right)^2}$$

For diff values of  $N$  all  $N$  circles intersect the real axis b/w -1 and origin only

## chapter 6

(192)

$$③ \quad X^2 + 0.95X + Y^2 + 1.125 = 0$$

$$\frac{X^2 + 0.95X}{M^2 - 1} + \frac{Y^2 + 1.125}{M^2 - 1} = 0$$

$$\frac{M^2}{M^2 - 1} = 1.125$$

$$M^2 - 1$$

$$M^2 = 1.125 \quad M^2 = 1.125$$

$$0.125 M^2 = 1.125$$

$$M = 3$$
